INTRODUCTION. NAMLS is the acronym given to a series of eleven international conferences organized to promote the development and application of "Nuclear Analytical Methods in the Life Sciences".

An analytical technique is a method that is used to determine the concentration of a chemical compound or chemical element. There are a wide variety of techniques used for analysis, from simple weighing (gravimetric analysis) to titrations (titrimetric) to very advanced techniques using highly specialized instrumentation. The most common techniques used in analytical chemistry are the following:

Analytical technique - Wikipedia

Chemical analysis is used to determine the qualitative or quantitative content of a given sample with the help of chemical and physical methods.

Although modern analytical chemistry is dominated by sophisticated instrumentation, the roots of analytical chemistry and some of the principles used in modern instruments are from traditional techniques, many of which are still used today.

In the field of pharmaceutical research, the analytical investigation of bulk drug materials, intermediates, drug products, drug formulations, impurities and degradation products, and biological samples containing the drugs and their metabolites is very important.

This Department covers a broad range of socio-economic sectors, from health, food and agriculture to the environment, water resources and industry. It assists Member States meet their development needs through nuclear science, technology and innovation. It also works with laboratories, universities and research facilities worldwide through the IAEA Collaborating Centre scheme.
